**Business Controls Inc.'s MySafeDashboard™
Wins 2006 Microsoft Partner Award**

Business Controls, Inc., an incident reporting and investigations firm, along with its technology partner, Fujitsu Consulting, was awarded the 2006 Microsoft Annual Partner Award with their Incident Reporting System, MySafeDashboard.

The prestigious annual competition, which drew a record 2,700 entries in 13 categories, recognizes Microsoft partners that have demonstrated outstanding competence and creativity in delivering innovative technology solutions for their customers.

Business Controls' reporting solution was developed by Fujitsu Consulting using Microsoft Visual Studio .NET over SQL Server 2005. The solution integrates Business Controls' incident reporting systems MySafeWorkplace® and MySafeCampus® with a comprehensive reporting system called MySafeDashboard. Anonymous incident reporting provides a safe and confidential method for employees to communicate concerns and issues to their employer over the Internet or through a telephone call center. Business Controls is the only company with a system that notifies employers within three minutes of the incident being reported.

MySafeWorkplace and MySafeCampus users can analyze the data obtained from incident reports through visual presentation functions such as data tables, pie charts and graphs. This allows clients to identify negative trends in the workplace and proactively take steps to resolve and prevent them.

Steve Foster, Business Controls' executive vice president and chief operating officer said of the award, "MySafeDashboard enables our customers to proactively manage incidents that are reported. This new reporting tool far exceeds anything else in the industry. As organizations face increasing litigation and threatened regulatory actions, we now help them eliminate many claims and risks. Fujitsu Consulting and Microsoft have made this possible, exceeding both our expectations and those of our clients." Craig Andrie of Fujitsu Consulting summed up, "This solution is entirely about getting critical information into the hands of the right people – instantly – using the power of an Internet-based Web application. Business Controls' Microsoft-based solution is the only one in their industry that can make that claim."
